

GCtrack[®] Asset & Fleet Management Industrial IoT Solution

Globecomm's Multi-Network, Satellite-Plus-Cellular, All-in-One Tracking Solution

Know Where Your Vehicles, Containers, and Assets Are Anytime, Anywhere with GCtrack[®]

GCtrack is a web based integrated satellite and GSM tracking solution, compatible with modern web browsers and works on a multilingual platform. **GCtrack** brings together all the positions of every manufactured product under one location and displays and manages them in a single unified interface. With **GCtrack**, asset locations and movements—including position, speed, altitude and heading—are tracked in real-time worldwide via GPS (Global Positioning System) updates.

By using GPS satellites with the latest hardware and technology, you can now track any asset on earth. Our technology allows you to merge together all types of tracking equipment into one easy to use platform. The tracking equipment determines its location using GPS and then transmits this information via GSM or satellite to a central server for processing. Any operator can monitor any number of real time assets simultaneously.

With so many hardware options available on the market, why not use one simple, universal web-based platform to bring them all together? **GCtrack** allows several channels of communication options to be integrated into its system, and let's not forget the numerous manufacturers we support as well. From Iridium to Inmarsat, to Cellular, **GCtrack** can monitor anything, anywhere in the world.

Major cellular providers support our GSM coverage. The use of GSM tracking hardware provides ideal coverage when in an urbanized setting. Because satellite signal can be compromised when surrounded by tall buildings, or even within one, GSM cellular coverage provides an optimal solution with satellite as a back up to continually track your assets. Partnering with all major satellite providers has allowed us to offer our clients premium satellite coverage from pole to pole. With a truly global networking system, we are confident that no matter where your business or personal endeavors may take you, we can connect you.

Satellite

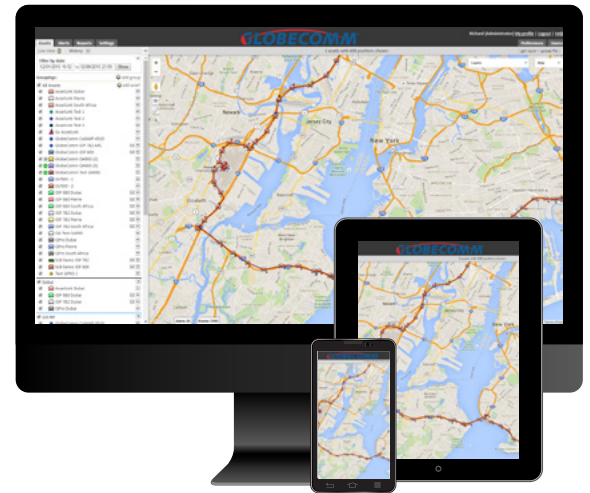

Satellite communication networks give visibility of assets in areas where GSM coverage is not received. Covering land and sea, satellites can provide a truly global reach.

GSM

GSM provides optimal coverage in urban land areas where satellite signals can be deterred by urban construction. Cellular coverage is the most popular tracking solution when operating in populated areas.

Hybrid Solutions

Customizing solutions for ideal visibility of assets is easily attained. Multiple coverage options with multi-network support will allow for the creation of optimal solutions that will provide the coverage that will meet the needs of our customers, as well as their budgets.

GTrack Features

- Live Update (No refresh times)
- Geo-Fencing
- Remote Configuration
- Advanced Alerts and Event Triggers
- Alert Acknowledgement
- User Management
- Two-Way Messaging
- Message Routing
- Messaging and Alert Email Encryption
- Alert SMS Notification
- Driver Assignment/Auditing
- I/O Mapping
- Fuel Logging
- Garmin Integration
- Reporting
- Position, Speed, Altitude & Heading
- Custom Map Support
